# CSC 588: Homework 1

#### Chicheng Zhang

#### February 3, 2021

- This homework is due on Feb 18 on gradescope.
- You are encouraged to discuss the homework questions with your classmates, but the discussions should
  only be at a high level, and you should write your solutions in your own words. For every question you
  have had discussions on, please mention explicitly whom you have discussed with; otherwise it may be
  counted as academic integrity violation.
- Feel free to use existing theorems from the course notes / the textbook.

#### Problem 1

- 1. Show that in  $\mathbb{R}^d$ , we can find at most d vectors that are pairwise orthogonal.
- 2. Next we will use Hoeffding's inequality to show that, in sharp contrast to above, it is possible to find exponentially many  $(n = e^{\Omega(d)})$  vectors that are almost orthogonal; that is, there exist  $x_1, \ldots, x_n$  in  $\mathbb{R}^d$ , such that for every pair (i, j)  $(1 \le i < j \le n)$ , the angle between  $x_i$  and  $x_j$  is between 89° and 91°. To this end, consider the following randomized construction:

Draw n random vectors  $X_1, X_2, \ldots, X_n$  in  $\mathbb{R}^d$ , where for each  $i, X_i = \frac{1}{\sqrt{d}}(Z_{i,1}, \ldots, Z_{i,d})$ . Here  $\{Z_{i,j}\}_{i \in \{1,\ldots,n\}, j \in \{1,\ldots,d\}}$ 's are iid, and  $Z_{i,j}$  takes value 1 with probability 1/2, and takes value -1 with probability 1/2.

- (a) Check that all  $X_i$ 's have unit length, i.e.  $||X_i||_2 = 1$ .
- (b) Use Hoeffding's Inequality to show that for any fixed pair  $i, j \in \{1, ..., n\}, i < j$ ,

$$\mathbb{P}(|\langle X_i, X_i \rangle| \ge \sin(1^\circ)) \le 2 \exp\{-0.00014d\}.$$

(c) Suppose  $n = \exp\{0.00005d\}$ . Use the union bound to show that

$$\mathbb{P}\left(\forall i < j, \text{ the angle between } X_i \text{ and } X_j \text{ is in } [89^\circ, 91^\circ]\right) > 0.$$

(Note that this proves the claim at the beginning of item 2.)

### Problem 2

Suppose we have an algorithm  $\mathcal{B}$  that learns hypothesis class  $\mathcal{H}$  in the following sense. There exists a function  $f:(0,1)\to\mathbb{N}$ , such that for any distribution D realizable by  $\mathcal{H}$ , for any  $\epsilon>0$ , if  $\mathcal{B}$  draws  $m\geq f(\epsilon)$  iid training examples from D, then with probability at least  $\frac{1}{2}$ ,  $\mathcal{B}$  returns a classifier whose generalization error on D is at most  $\epsilon$ .

Now, given  $\mathcal{B}$ , and the ability to draw fresh training examples, how can you design an algorithm  $\mathcal{A}$  that  $(\epsilon, \delta)$ -PAC learns  $\mathcal{H}$  for any  $\epsilon$  and  $\delta$ ? What is  $\mathcal{A}$ 's sample complexity?

## Problem 3

1. Show that the class of non-homogeneous linear classifiers

$$\mathcal{H} = \left\{ h_{w,b}(x) = 2I(\langle w, x \rangle + b > 0) - 1 : w \in \mathbb{R}^d, b \in \mathbb{R} \right\}$$

has VC dimension d+1.

2. Define the class of polynomial threshold functions

$$\mathcal{H}_n = \{2I(p(x) > 0) - 1 : p \text{ is a polynomial of } x \text{ of degree } \le n\}$$

(where  $x \in \mathbb{R}$ ). What is the VC dimension of  $\mathcal{H}$ ?

3. Suppose we have a natural number  $v \geq 1$ , and l hypothesis classes  $\mathcal{H}_1, \mathcal{H}_2, \dots, \mathcal{H}_l$ , where for every i,  $VC(\mathcal{H}_i) \leq v$ . Define  $\mathcal{H} \triangleq \bigcup_{i=1}^l \mathcal{H}_i$ . Show that there exists some constant c > 0 such that

$$VC(\mathcal{H}) \le c \cdot (v \ln(v) + \ln(l))$$
.

## Problem 4

In this exercise, we will unify the analysis of the empirical risk minimization algorithm in realizable and agnostic settings to recover the  $O(\frac{1}{\epsilon})$ -type sample complexity and the  $O(\frac{1}{\epsilon^2})$ -style sample complexity given in the class, using Bernstein's Inequality. Suppose  $\mathcal{H}$  is a finite hypothesis class, D is a distribution over labeled examples, and S is a training set of size m drawn iid from D. Denote by  $\nu^* = \min_{h \in \mathcal{H}} \operatorname{err}(h, D)$  as the optimal generalization error, and  $\hat{h}$  the output of the empirical risk minimization algorithm.

1. Using the Bernstein's Inequality we have seen in the class, show that with probability  $1 - \delta$ , for all classifiers h in  $\mathcal{H}$ ,

$$\operatorname{err}(h, S) \le \operatorname{err}(h, D) + \sqrt{\operatorname{err}(h, D) \frac{4 \ln \frac{2|\mathcal{H}|}{\delta}}{m}} + \frac{2 \ln \frac{2|\mathcal{H}|}{\delta}}{m},$$

$$\operatorname{err}(h,D) \leq \operatorname{err}(h,S) + \sqrt{\operatorname{err}(h,S) \frac{4 \ln \frac{2|\mathcal{H}|}{\delta}}{m}} + \frac{12 \ln \frac{2|\mathcal{H}|}{\delta}}{m}.$$

(Hint: to get the second inequality, you can use the elementary fact that for  $A, B, C > 0, A \le B + C\sqrt{A}$  implies  $A \le B + C^2 + C\sqrt{B}$ . To avoid carrying around the cumbersome  $\frac{\ln \frac{2|\mathcal{H}|}{\delta}}{m}$  term, I suggest denoting it by another symbol, e.g.  $\alpha$ , in your calculation)

2. Show that with probability  $1 - \delta$ ,  $\hat{h}$  satisfies that

$$\operatorname{err}(\hat{h}, D) \le \nu^* + c_1 \sqrt{\frac{\ln \frac{2|\mathcal{H}|}{\delta}}{m}} \nu^* + c_2 \frac{\ln \frac{2|\mathcal{H}|}{\delta}}{m},$$

for some positive constants  $c_1$  and  $c_2$ . (Hint: you may find the following elementary facts useful: for  $A, B > 0, \sqrt{AB} \le A + B, \sqrt{A + B} \le \sqrt{A} + \sqrt{B}$ . The tightness of constants  $c_1$  and  $c_2$  won't be graded.)

- 3. Use the above item to conclude that:
  - (a) There exists a function  $m_A$  such that  $m_A(\epsilon, \delta) = O(\frac{\ln |\mathcal{H}| + \ln \frac{1}{\delta}}{\epsilon^2})$ , when  $m \geq m_A(\epsilon, \delta)$ , for all distributions D,  $\operatorname{err}(\hat{h}, D) \leq \nu^* + \epsilon$  with probability  $1 \delta$ .
  - (b) There exists a function  $m_R$  such that  $m_R(\epsilon, \delta) = O(\frac{\ln |\mathcal{H}| + \ln \frac{1}{\delta}}{\epsilon})$ , when  $m \geq m_R(\epsilon, \delta)$ , for all distributions D such that  $\nu^* = 0$ ,  $\operatorname{err}(\hat{h}, D) \leq \epsilon$  with probability  $1 \delta$ .

# Problem 5

How much time did it take you to complete this homework?
